**UX Case Study — EduLearn Online Learning Platform**

**Project Title:** EduLearn Mobile Learning Application

**Author:** Manahil Rehman

**Role:** UI/UX Design Intern

**Organization:** CodeAlpha Internship Program

**Tools Used:** Figma, Figma AI, Markdown, GitHub

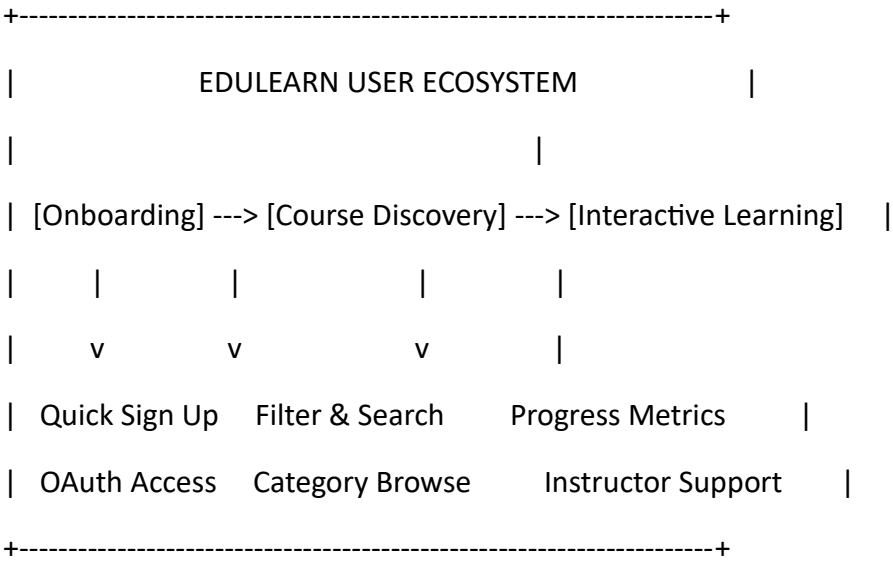

**Deliverables:** Low-Fidelity Wireframes, High-Fidelity UI Screens, Clickable Prototype, UX Case Study Report

## 1. Executive Summary & Project Overview

### 1.1 Executive Summary

The rapid shift toward digital education has highlighted the necessity for intuitive, engaging, and accessible mobile learning platforms. **EduLearn** is a mobile application designed to bridge the gap between complex digital learning workflows and user-friendly mobile interfaces.

This case study documents the end-to-end design process, user research, wireframing, high-fidelity UI design, prototyping, and usability analysis conducted during the CodeAlpha UI/UX Design Internship. The focus was to streamline core user workflows: account onboarding, course discovery, progress tracking, community engagement, and direct instructor support.

### 1.2 Problem Statement

Modern learners frequently encounter digital learning platforms that suffer from over-cluttered interfaces, fragmented communication channels, and unintuitive progress tracking. These UX friction points lead to decreased course completion rates and low user retention.

Key problems identified include:

1. **Navigation Overhead:** Difficulty in switching between active courses, community discussions, and instructor feedback.
2. **Cognitive Overload:** Dense content representation on small mobile viewports.
3. **Communication Friction:** Fragmented methods for seeking clarification from instructors during module completion.

**1.3 Project Goals & Objectives**

- **Goal 1:** Create an accessible, minimal grey-toned wireframe system establishing visual hierarchy and content structure.
- **Goal 2:** Design a cohesive 8-screen high-fidelity mobile app layout adhering to modern mobile UI patterns (iOS / Android standards).
- **Goal 3:** Establish an interactive, end-to-end clickable prototype demonstrating core user flows.
- **Goal 4:** Conduct a systematic UX evaluation to propose concrete usability enhancements.

**2. Target Audience & Personas**

**2.1 Primary Target Audience**

- **Demographics:** University students, early-career professionals, and self-paced technical learners (Ages 18–35).
- **Technical Proficiency:** Moderate to High.
- **Device Usage:** Primary access via smartphones (iOS / Android) during commutes or short break intervals.

**2.2 User Personas**

**Persona 1: The Goal-Oriented Professional**

- **Name:** Sara Ahmed
- **Age:** 24

- **Role:** Junior Data Analyst
- **Goals:** Wants to complete micro-certification courses in SQL and Python on her daily commute.
- **Pain Points:** Hard to track daily completion stats; struggles with complex navigation when trying to ask quick questions to mentors.
- **Need:** Clear progress indicators and direct, low-friction instructor messaging.

**Persona 2: The Undergraduate Student**

- **Name:** Bilal Khan
- **Age:** 20
- **Role:** Computer Science Student
- **Goals:** Access supplementary lecture notes, engage in peer group discussions, and review upcoming assignments.
- **Pain Points:** Overwhelmed by excessive text and complex menus on mobile screens.
- **Need:** Clean visual layout with prominent visual cues for live sessions and submission deadlines.

**3. User Journey & Task Flow**

The core workflow of EduLearn was designed around a 5-stage sequential user journey.

[Stage 1: Onboarding]

|

▼

[Stage 2: Catalog Browsing]

|

▼

[Stage 3: Dashboard & Progress Review]

|

▼

[Stage 4: Activity & Community Interaction]

|

▼

[Stage 5: Instructor Support Chat]

### 3.1 Stage-by-Stage Breakdown

| Stage | User Action | Screen / Touchpoint | UX Goal |
|---|---|---|---|
| **1. Onboarding** | Enters email or uses OAuth (Google/Apple) | Learner Sign Up Screen | Single-step account creation with minimal input fields. |
| **2. Discovery** | Searches for specific topics or filters by category | Course Catalog & Search | Clear filtering chips and intuitive card layouts. |
| **3. Progress Tracking** | Views completed courses and weekly activity graphs | Learner Progress Dashboard | High visual impact metrics (progress curves, stats cards). |
| **4. Community** | Reviews discussion threads and shared resources | Learning Activity & Community | Tabbed layout separating notes, discussions, and grades. |
| **5. Support** | Sends a direct message to the assigned instructor | Instructor Support Chat | Conversational interface with status indicators and quick attachments. |

## 4. Key Strengths & Pain Points Analysis

### 4.1 Key Design Strengths

1. **Clean Visual Hierarchy:** The neutral grey-toned wireframing approach ensures that typography and key structural elements guide the user's focus naturally.

2. **Unified Navigation System:** Bottom navigation bar and explicit tab headers (Overview, Courses, Certificates) keep key sections reachable within 1–2 taps.
3. **Consolidated Support Channel:** Dedicated instructor support chat screen reduces cognitive switching between external chat tools and the learning platform.
4. **Data Visualization:** High-contrast line charts on the Learner Progress Dashboard present complex metric trends clearly within small viewports.

**4.2 Identified UX Pain Points**

1. **Information Density on Small Viewports:** In screens like *Learning Activity*, listing multiple activity types (discussions, grades, quizzes) simultaneously can crowd mobile viewports.
2. **Multi-Step Enrollment Flow:** The transition from course discovery to active lesson viewing requires traversing multiple confirmation dialogs.
3. **Support Accessibility:** Accessing instructor chat requires navigating through menu hierarchies rather than being available contextually inside lesson screens.

**5. Three Proposed UX/UI Improvements**

To address the identified pain points, the following targeted UX enhancements are recommended for future design iterations:

**Improvement 1: Contextual Floating Action Button (FAB) for Live Sessions & Questions**

- **Problem:** Users must exit their current learning module to initiate support or view live schedule updates.
- **Proposed Solution:** Implement a contextual Floating Action Button on learning screens that expands into quick options: *"Ask Instructor"*, *"Join Live Call"*, or *"Take Quick Notes"*.
- **UX Impact:** Reduces task completion time by eliminating menu traversal steps.

**Improvement 2: Streamlined One-Tap Course Enrollment Cards**

- **Problem:** Course enrollment currently involves navigating away from the catalog into detailed modal dialogs.
- **Proposed Solution:** Introduce progressive disclosure course cards featuring an inline *"Quick Enroll"* toggle alongside course rating summaries.
- **UX Impact:** Lowers drop-off rates during course selection and speeds up user onboarding.

**Improvement 3: Embedded Audio/Video Call Controls in Instructor Chat**

- **Problem:** Text-only support chat can slow down technical troubleshooting when learners need quick verbal clarification.
- **Proposed Solution:** Integrate direct audio/video call invitation buttons at the top navigation bar of the Learner Support Chat screen.
- **UX Impact:** Enhances user trust and provides real-time resolution channels for complex learning queries.

## 6. Conclusion & Reflection

### 6.1 Project Conclusion

The **EduLearn Mobile Application** project successfully fulfilled all requirements specified in the CodeAlpha UI/UX Design Internship track:

- Developed a complete 8-screen wireframe system.
- Implemented a cohesive high-fidelity mobile design layout.
- Constructed a fully interactive, clickable prototype.
- Conducted a thorough UX evaluation resulting in actionable recommendations.

By prioritizing clear visual hierarchy, intuitive data representation, and structured navigation, EduLearn provides a solid foundation for an accessible, learner-centric mobile experience.

### 6.2 Key Internship Takeaways

1. **Iterative Design Process:** Transitioning from structural low-fidelity wireframes to interactive high-fidelity prototypes ensures core UX flaws are caught early.
2. **Design System Consistency:** Reusing standardized button sizes, typography scales, and padding guidelines across screens yields a polished, professional output.
3. **User-Centric Mindset:** Evaluating designs through defined user personas ensures every UI element directly serves a practical learner need.
